Big Data in the Arts and Humanities Sep 01 2022 As digital technologies occupy a more central role in working and everyday human life, individual and social realities are increasingly constructed and communicated through digital objects, which are progressively replacing and representing physical objects. They are even shaping new forms of virtual reality. This growing digital transformation coupled with technological evolution and the development of computer computation is shaping a cyber society whose working mechanisms are grounded upon the production, deployment, and exploitation of big data. In the arts and humanities, however, the notion of big data is still in its embryonic stage, and only in the last few years, have arts and cultural organizations and institutions, artists, and humanists started to investigate, explore, and experiment with the deployment and exploitation of big data as well as understand the possible forms of collaborations based on it. *Big Data in the Arts and Humanities: Theory and Practice* explores the meaning, properties, and applications of big data. This book examines the relevance of big data to the arts and humanities, digital humanities, and management of big data with and for the arts and humanities. It explores the reasons and opportunities for the arts and humanities to embrace the big data revolution. The book also delineates managerial implications to successfully shape a mutually beneficial partnership between the arts and humanities and the big data- and computational digital-based sciences. Big data and arts and humanities can be likened to the rational and emotional aspects of the human mind. This book attempts to integrate these two aspects of human thought to advance decision-making and to enhance the expression of the best of human life.

Handbook of Research on Innovations and Applications of AI, IoT, and Cognitive Technologies May 29 2022 Recently, artificial intelligence (AI), the internet of things (IoT), and cognitive technologies have successfully been applied to various research domains, including computer vision, natural language processing, voice recognition, and more. In addition, AI with IoT has made a significant breakthrough and a shift in technical direction to achieve high efficiency and adaptability in a variety of new applications. On the other hand, network design and optimization for AI applications addresses a complementary topic, namely the support of AI-based systems through novel networking techniques, including new architectures, as well as performance models for IoT systems. IoT has paved the way to a plethora of new application domains, at the same time posing several challenges as a multitude of devices, protocols, communication channels, architectures, and middleware exist. Big data generated by these devices calls for advanced learning and data mining techniques to effectively understand, learn, and reason with this volume of information, such as cognitive technologies. Cognitive technologies play a major role in developing successful cognitive systems which mimic "cognitive" functions associated with human intelligence, such as "learning" and "problem solving." Thus, there is a continuing demand for recent research in these two linked fields. *The Handbook of Research on Innovations and Applications of AI, IoT, and Cognitive Technologies* discusses the latest innovations and applications of AI, IoT, and cognitive-based smart systems. The chapters cover the intersection of these three fields in emerging and developed economies in terms of their respective development situation, public policies, technologies and intellectual capital, innovation systems, competition and strategies, marketing and growth capability, and governance and relegation models. These applications span areas such as healthcare, security and privacy, industrial systems, multidisciplinary sciences, and more. This book is ideal for technologists, IT specialists, policymakers, government officials, academics, students, and practitioners interested in the experiences of innovations and applications of AI, IoT, and cognitive technologies.

The Caravan Mar 15 2021 Aadhaar was originally pitched as a way to eliminate identity fraud in the delivery of public benefits. Today, its application far exceeds that purpose. Nandan Nilekani, the technology billionaire who was the prime mover behind Aadhaar, has said that "data has become the new oil," and that "if we can restructure data to benefit every individual and every business, then we can lead to enormous amount of activity and economic growth." He has also said, "In the West, the identity business was privatised. That's a much more unsafe model than when a government issues an ID." But while Aadhaar is presented as a way to mobilise Indians' data for the public good, the lines between those who run Aadhaar and those who profit from it are blurry. Also in this issue: Praveen Donthi on how the dilution of the SC/ST Act is reigniting Dalit anger against the BJP and RSS; Nilakantan RS on the deepening fault lines between southern states and the Indian union; Kamayani Sharma on October's experiments with the Bollywood romance genre; Sanam Meher on what Qandeel Baloch left behind; Ross Adkin on how Brexit negotiations are raising uncomfortable questions in Northern Ireland; Senthil Kumaran on the conflict between humans and tigers in India.

Anthropocene Antarctica Dec 12 2020 *Anthropocene Antarctica* offers new ways of thinking about the 'Continent for Science and Peace' in a time of planetary environmental change. In the Anthropocene, Antarctica has become central to the Earth's future. Ice cores taken from its interior reveal the deep environmental history of the planet and warming ocean currents are ominously destabilising the glaciers around its edges, presaging sea-level rise in decades and centuries to come. At the same time, proliferating research stations and tourist numbers challenge stereotypes of the continent as the 'last wilderness.' The Anthropocene brings Antarctica nearer in thought, entangled with our everyday actions. If the Anthropocene signals the end of the idea of Nature as separate from humans, then the Antarctic, long considered the material embodiment of this idea, faces a radical reframing. Understanding the southern polar region in the twenty-first century requires contributions across the disciplinary spectrum. This collection paves the way for researchers in the Environmental Humanities, Law and Social Sciences to engage critically with the Antarctic, fostering a community of scholars who can act with natural scientists to address the globally significant environmental issues that face this vitally important part of the planet.
